DETAILED ACTION

1. The response received on 02-15-2006 has been placed in the file and was considered by the examiner. An action on the merits follows.

Response to Arguments

2. The arguments filed on 02-15-2006 have been fully considered. A response to these arguments is provided below.

37 CFR 1.75 Claim Objections

Summary of Argument:

Applicant's amendment has obviated the previous claim objection.

Prior Art Rejections

Summary of Argument:

Applicant amended independent claims 1 and 7. Applicant makes a general statement that these claims are allowable. (see remarks, pg. 8).

Examiner's Response:

Applicant's arguments fail to comply with 37 CFR 1.111(b) because they amount to a general allegation that the claims define a patentable invention without specifically pointing out how the language of the claims patentably distinguishes them from the references.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 4. Claims 1-7 are rejected under 35 U.S.C. 102(e) as being anticipated by MacInnis et al. (USPN 6,573,905). Regarding Independent Claims 1 and 7:

Application/Control Number: 09/818,399

Art Unit: 2621

MacInnis discloses setting a blending coefficient alpha (which has a value between 0 and 1) at a specified value proportional to a value of a specific picture element component included in picture element components A of a first image when said value of the specific picture element is not zero (MacInnis col. 110 lines 35-56: The alpha value disclosed in MacInnis is analogous to the blending coefficient recited in the claim. MacInnis discloses performing a comparison operation, and then setting the alpha value at 1 if this comparison comes out negative (i.e. a normal image component is found). MacInnis further discloses that this alpha value can either be set at 1 (i.e. a single alpha value) or that it can be set to a value proportional to a specific picture element value (see lines 37-42 for three other alpha determination methods which anticipate this limitation).)

MacInnis further discloses setting the specified value to zero if the specific picture element is zero (col. 110 lines 35-56: MacInnis discloses setting the alpha value to zero if a comparison operation gives a positive result (i.e. it is not a normal image component).).

MacInnis further discloses a means for performing an operation on the picture element components A, the picture element components B of a second image, and the blending coefficient alpha by using the formula (B*(1-alpha) + A*alpha) (col. 110 line 20). The Top Layer and Bottom Layer disclosed in MacInnis correspond to the first and second images, respectively, as recited in the claim.

With respect to the limitation that the first image is a still image and the second image is a moving image, MacInnis discloses that the top and bottom layers (i.e. the first and second images) are "graphics layers" (col. 110 line 17). MacInnis further discloses that "graphics" includes graphics, text, or video (col. 1 lines 59-60). Thus, MacInnis discloses the first image as a still image (a graphics or text image) and the second image as a moving image (i.e. a video image).

MacInnis further discloses performing this operation on all the picture element components which have a specific picture element component representing the predetermined value (col. 110 lines 20-30). The image pixels disclosed in MacInnis are analogous to the picture elements as recited in the claim.

Regarding the Dependent Claims:

With regard to claim 2, the claim will be interpreted as follows. The predetermined value of a specific picture element component in a first image, which corresponds to a specified value of a blending coefficient, is a value which falls outside of a specified range and does not affect image display.

MacInnis discloses a predetermined value of zero (col. 110 line 66 – col. 111 line 5). This predetermined value falls outside of a specified range (16-235) and does not affect the display of the image (transparent).

With regard to claim 3, MacInnis further discloses the specific picture element component is a luminance component (col. 110 line 66 – col. 111 line 5).

With regard to claim 4, MacInnis further discloses setting the blending coefficient at zero when the specific picture element component is zero, and setting it to unity when the component is other than zero (col. 110 line 66 – col. 111 line 5).

Application/Control Number: 09/818,399

Art Unit: 2621

With regard to claim 5, MacInnis further discloses setting the blending coefficient at zero when the specific picture element component is zero, and setting it to a specified value that satisfies, 0 < alpha <= 1, when the component is other than zero (col. 110 line 66 – col. 111 line 5).

With regard to claim 6, MacInnis further discloses that the data of both the first and second images are data in an ITU-R601 format having a luminance component and a color difference component as said picture elements A and B, respectively (col. 6 lines 40-49).

Regarding claim 8, MacInnis further discloses that the specific picture element component is a color component or a color difference component when image data includes a color component or a color difference component (MacInnis col. 110 lines 41-42: The reference describes that color is a specific picture element component).

Regarding claim 9, MacInnis further discloses that a relationship between the specific picture element component and the blending coefficient is preset in an image generation means (MacInnis col. 110 lines 34-43: The reference describes four different relationships—which are preset in an image generation means by a user.).

Regarding claim 10, MacInnis further discloses that a relationship between the specific picture element component and the blending coefficient is selected by a user (MacInnis col. 110 lines 34-43: The reference describes four different relationships—which are preset in an image generation means by a user.).

Conclusion

5. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Patrick L Edwards whose telephone number is (571) 272-7390. The examiner can normally be reached on 8:30am - 5:00pm M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Joe Mancuso can be reached on (571) 272-7695. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
